The innovative platform for digital sales & ticketing

Higher, further, faster: eos.ticketingsuite is our new sales platform that takes ticketing to a new level.

Fast, scalable and robust

eos.ticketingsuite offers highly scalable systems and uncompromisingly fast ticketing. The online sales system reacts flexibly to large volumes of ticket requests. This guarantees extremely fast response times even during peak periods. At the same time, the system is stable and has an extremely high performance level.

Countless possibilities

eos.ticketingsuite offers countless possibilities and therefore provides a strong technological basis for your services! Bus, train or tram – the traditional means of public transport can already be fully integrated. Following the principle of MaaS (Mobility as a Service), other means of transport will also be integrated into

eos.ticketingsuite in the future, e. g. bike, scooter or car sharing services, park & ride or autonomous vehicles.

Furthermore, eos.ticketingsuite can be linked with a variety of other systems and applications. eos.ticketingsuite is, of course, applicable across all platforms – no matter whether on a tablet, laptop or smartphone. In addition to various B2C offers such as apps and web shops, the system also provides offers specifically focused on B2B needs such as corporate customer or API-only solutions. Due to its various integration possibilities, eos.ticketingsuite adapts to the needs of the customer.

Comprehensive one-stop solution

eos.ticketingsuite offers support for a variety of fare products to ensure comprehensive coverage of various mobility services. These can be maintained centrally or integrated via a tariff interface. eos.ticketingsuite's product modules, based on the product and control modules (PCM) technology,

Everything begins with a solid basis: the eos.ticketingsuite

can easily be copied, modified and uploaded back into the productive system or a test system. In addition to standard tickets, the system also offers student, subscription and combo tickets. eos.ticketingsuite supports UIC and VDV barcodes and, in the future, will also support the new standard mobile+.

Comprehensive and convenient payment options mean more turnover: to make it as easy as possible for passengers, eos.ticketingsuite offers a number of possibilities in this regard. In addition to traditional payment methods such as SEPA Direct Debit, credit card or PayPal, popular state-of-the-art options such as Apple Pay or Google Pay are also available. Logpay, Pay Unity, Six Payment Services, Redsys and others are integrated as payment providers.

eos.ticketingsuite: a convincing solution for passengers that comes with a strong performance in service and marketing. All relevant functions are available for your service staff to guarantee best possible customer support. Our solution enables your staff to reach their destination faster so that they can focus their efforts on the customer. Care for some exciting insights? No problem!

eos.ticketingsuite comes with management reports and detailed analyses that promise better and faster insights into your sales.

User-friendly and modern: app and back-end are extremely easy to use thanks to the latest UX & UI and they also come in a new, contemporary design. Lean registration with profile data collection or the separation of purchase and activation of tickets are only two of a number of optimized functions. The app is user-centered throughout to guide passengers through the purchasing process as quickly and conveniently as possible. In addition, it includes the option of a third-party lib integration without UI, where the transport company can design the interfaces completely by itself.

Another milestone is the flexible integration of the most convenient and modern ticketing innovation: our XiXo solution offers the whole range of in-/out technologies and flexible pay-as-you-go billing including best-price optimisation (from Check-in/Check-out to Be-in/Be-out ticketing). The integration of XiXo.easy (CiaCo) in particular is ideal for an easy start.

eos.ticketingsuite's technical basis provides comprehensive advantages

In addition to its speed, reliability and scalability, eos.ticketingsuite's greatest asset is its multi-client capability. It is a modular system based on microservices (e.g. payment service, user management service, signing service). Due to the greater independence of the individual functions and modules, they can be updated separately and additional modules can be added flexibly. Front-end applications are logically separated from the core system, allowing independent further development of the individual components. Thanks to the redundant services, no downtime for updates is necessary. Each service has its own release cycle and independent deployment.

Last but not least: the software is the result of a fully agile development process with interdisciplinary teams and can therefore always be adapted to current market conditions.
